Speciated Landings

If $\lambda_{\cdot klm\eta}$ is the observed landings of **all species** in the k^{th} port, caught with the l^{th} gear, in the η^{th} quarter, of year m, in particular market category. Then,

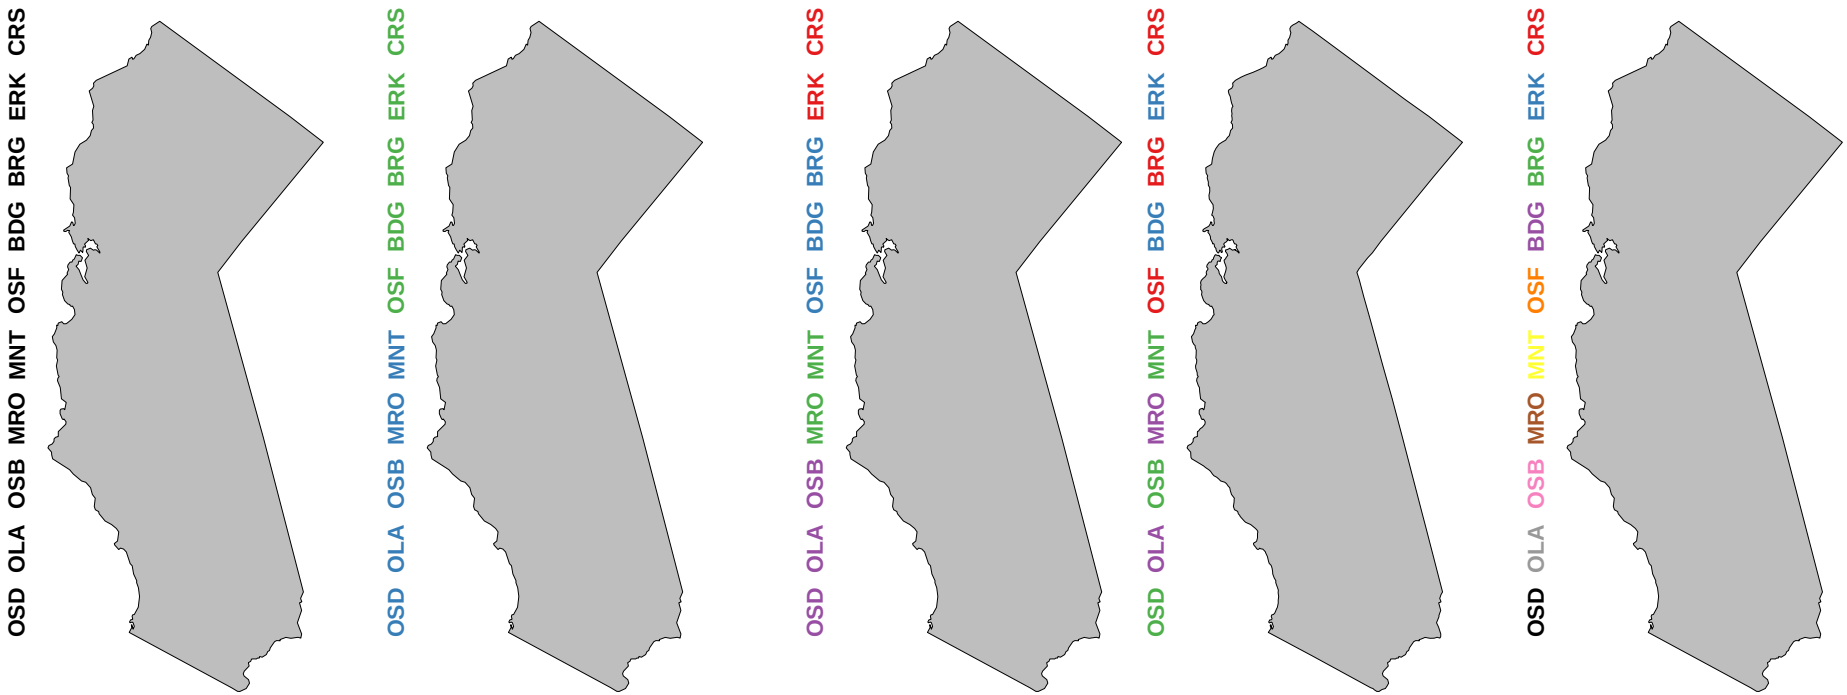
$$\lambda^*_{jklm\eta} = \lambda_{\cdot klm\eta}\pi^*_{jklm\eta}$$

$$\lambda^*_{jklm\cdot} = \sum_{\eta} \lambda^*_{jklm\eta}$$

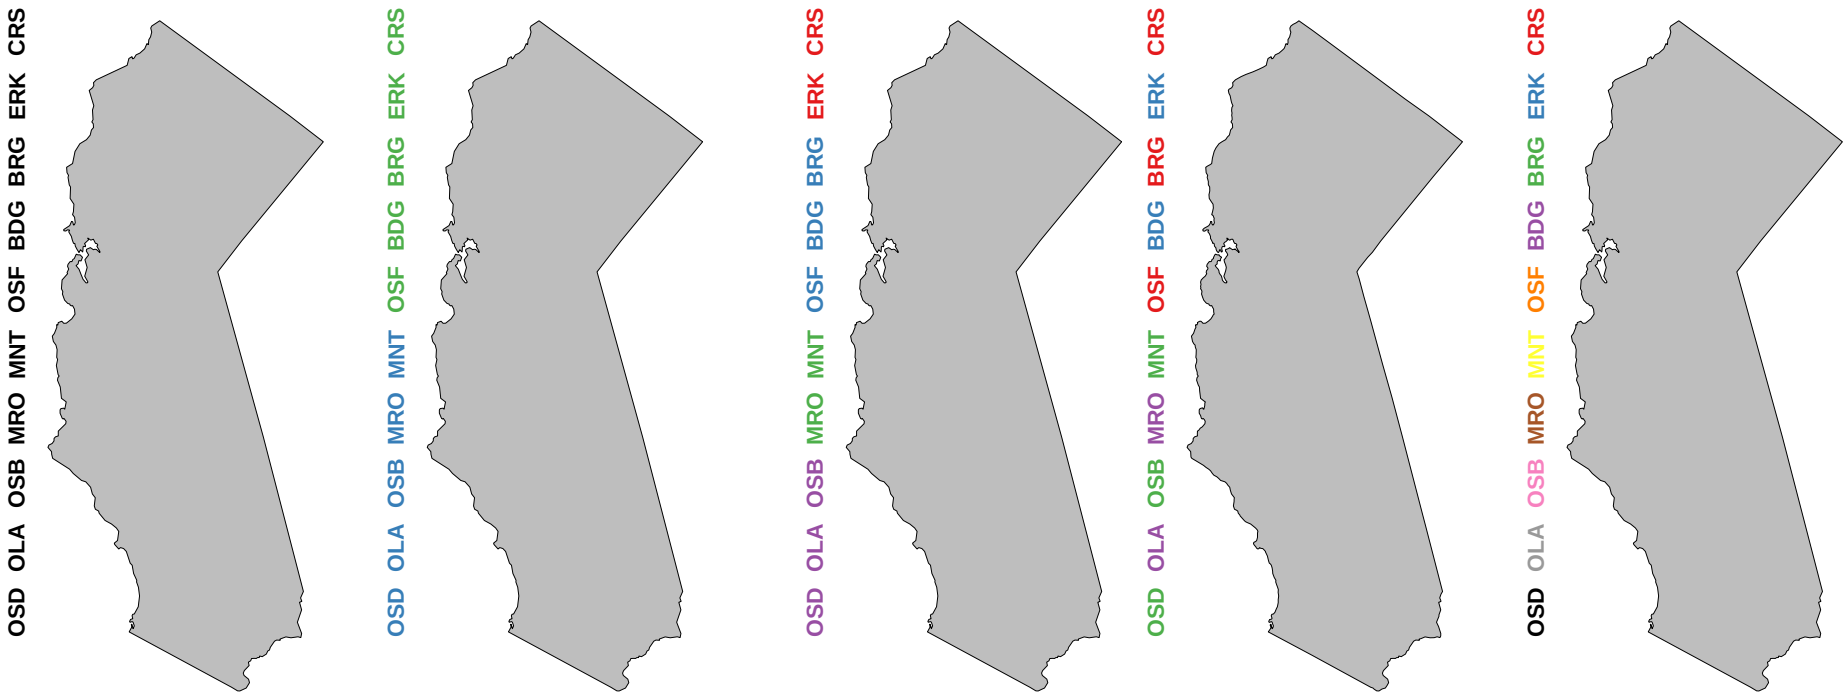
$$\lambda^*_{j\cdot lm\cdot} = \sum_{k}\sum_{\eta} \lambda^*_{jklm\eta}$$

$$\lambda^*_{j\cdot\cdot m\cdot} = \sum_{l}\sum_{k}\sum_{\eta} \lambda^*_{jklm\eta}$$

$$\mathrm{MSE}(\hat{\theta}) = \mathbb{E}\left[(\hat{\theta} - \theta)^2 \right] = \overbrace{\mathbb{E}\left[\left(\hat{\theta} - \mathbb{E}(\hat{\theta})\right)^2 \right]}^{\mathrm{Var}(\hat{\theta})} + \overbrace{\left(\mathbb{E}(\hat{\theta}) - \theta \right)^2}^{\mathrm{Bias}(\hat{\theta},\theta)^2}$$



$$B_K = \sum_{\kappa=0}^{K} \frac{1}{\kappa!} \left(\sum_{j=0}^{\kappa} (-1)^{\kappa-j} \binom{\kappa}{j} j^K \right)$$



$$B_{10} = 115975$$

Bayesian Model Averaging (BMA)

Consider a set of Models (M) indexed by ι:

$$\omega_\iota = Pr(M_\iota|y) = \frac{p(y|M_\iota)p(M_\iota)}{\sum_\iota p(y|M_\iota)p(M_\iota)}$$

$$\bar{p}(\boldsymbol{\theta}|\mathbf{y}) = \sum_\iota \omega_\iota p(\boldsymbol{\theta}|\mathbf{y}, M_\iota)$$

if f only depends on M through $\boldsymbol{\theta}$, then

$$\bar{p}(y^*|\mathbf{y}) = \int f(y^*|\boldsymbol{\theta})\bar{p}(\boldsymbol{\theta}|\mathbf{y})\mathbf{d}\boldsymbol{\theta}$$

1983-1990

Proof: Species Comps Sum to One... as do Their Means.

If y_{jk} is the k^{th} draw, $k \in \{1, ..., K\}$, of the posterior predictive weight of species j in a particular stratum. Then,

$$\pi_{jk} = \frac{y_{jk}}{\sum_j y_{jk}} \quad \mathbf{y}_k \neq \mathbf{0}. \tag{1}$$

The predictive mean for species j is,

$$\hat{\pi}_j = \frac{\sum_k^K \pi_{jk}}{K}. \tag{2}$$

Summing $\hat{\pi}_j$ across species, it follows from (1) and (2) that,

$$\sum_j \hat{\pi}_j \overset{(2)}{=} \sum_j \frac{\sum_k^K \pi_{jk}}{K} = \frac{\sum_k^K \sum_j \pi_{jk}}{K} \overset{(1)}{=} \frac{\sum_k^K \sum_j \frac{y_{jk}}{\sum_j y_{jk}}}{K} = \frac{\sum_k^K 1}{K} = \frac{K}{K} = 1. \quad \blacksquare$$

Landings Weighted

$$y_{ijklm\eta} \sim \text{Beta-Binomial}\Big(\mu(\theta_{jklm\eta}),\ \sigma^2(\theta_{jklm\eta}, \rho)\Big)$$

$$\theta_{jklm\eta} = \beta_0 + \beta_j^{(s)} + \beta_k^{(p)} + \beta_l^{(g)} + \beta_{m\eta}^{(y:q)} + \boldsymbol{\beta}^{(\ell)}\boldsymbol{\ell}$$

$$\beta_0 \propto 1$$
$$\beta_j^{(s)} \sim N(0, 32^2)$$
$$\beta_k^{(p)} \sim N(0, 32^2)$$
$$\beta_l^{(g)} \sim N(0, 32^2)$$
$$\boldsymbol{\beta}^{(\ell)} \sim \mathbf{N(0, 32^2)}$$

$$\text{logit}(\rho) \sim N(0, 2^2)$$

$$\beta_{m\eta}^{(y:q)} \sim N(0, v)$$
$$v \sim IG(1, 2x10^3)$$
$$\forall \ \ v$$

$$j \in \{1, ..., J\} \text{ Species}$$
$$k \in \{1, ..., K\} \text{ Ports}$$
$$l \in \{1, ..., L\} \text{ Gears}$$
$$m \in \{1, ..., M\} \text{ Years}$$
$$\eta \in \{1, ..., H\} \text{ Quarters}$$

Vessel Effects

$$y_{ijklm\eta\nu} \sim \text{Beta-Binomial}\Big(\mu(\theta_{jklm\eta\nu}),\ \sigma^2(\theta_{jklm\eta\nu}, \rho)\Big)$$

$$\theta_{jklm\eta} = \beta_0 + \beta_j^{(s)} + \beta_k^{(p)} + \beta_l^{(g)} + \beta_{m\eta}^{(y:q)} + \boldsymbol{\beta_\nu^{(v)}}$$

$$\beta_0 \propto 1$$
